This prototype should be interpreted as a booking site but if developed more can help users create the best vacation for them. Some of the notable are the Error and Thank You messages because it helps users know their progress towards completing the goal. Some of the engineering challenges that I experienced included my code messing up, which made it hard for some pages to work, but that was caused by me copying and pasting without learning how to properly implement them. I had to take some time to deal with balancing aesthetics, functionality, and my skill level which made me do some redesigns for some parts of the website. The CSS had moments of not working which meant choosing a different method of CSS to see if my problem would be solved which was it. Overall, most of the engineering challenges I experienced came from not taking the time to assess if my project looked good but also functioned properly, so if users do use this website, they still plan their trips without struggling with the functional errors in my code.
